GENERAL FOSSIL COLLECTION

Fossils are preserved remains of past life or trace evidence of such life. Rapid burial is a primary factor in fossilization. Marine plants and animals are fossilized more frequently than land organisms because they undergo rapid burial more readily. One of a number of processes may lead to fossilization. These processes may be as simple as the freezing of a plant or animal or as complex as minerals filling voids in the bones or shells of an organism to complete the process of fossilization.
